

Apullma automated bucket filling plant

Automatic isolation of fluids, creamy and free-flowing products

Manual separation of optimal priced containers is finally passe with the Automatic Bucket Separation Unit from Apullma. The containers are separated by the machine, which sends them individually to a suitable filling plant, which can also be obtained from Apullma, after which the containers are sealed automatically. The machine fills the optimal priced containers with liquids and creamy flowing products from diverse industries.

Benefits at a glance

- Automatic isolated bucket stacking, includes follow on feeding and filling
- Time and cost effective, eliminates manual isolation operation
- For colours and varnishes, granules and organic salts, fodder and fertilizers as well as the packing of large containers
- Also available in stainless steel
- Possible integration with a weight feeder
- Built to customer requirements specifications
